Introduction

- If property A holds for any subfamily of a family of sets F that is of a given finite size h and property, then some property B holds for the whole family F of arbitrary finite size n
- Equivalent statement: If property B doesn't hold for F, then A doesn't hold for some subfamily of size h.

Helly number: 2d

Piercing Boxes

Definition: A set *P* **pierces** a family of sets \mathcal{F} if for any set $S \in \mathcal{F}$ there is an element $p \in P$ such that $p \in S$. If |P| = n, then \mathcal{F} is *n*-pierceable

Piercing Boxes

All Helly-type statements are proven!

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Piercing Boxes

- All Helly-type statements are proven!
- ► Theorem (Danzer, Grünbaum). If h = h(d, n) is the smallest positive integer such that for any finite family *F* of axis-parallel boxes in ℝ^d every h-tuple from *F* is n-pierceable implies that *F* is n-pierceable then following are the values of h:

$$h(d, 1) = 2$$

$$h(1, n) = n + 1$$

$$h(d, 2) = \begin{cases} 3d : 2 \mid d \\ 3d - 1 : 2 \nmid d \end{cases}$$

$$h(2, 3) = 16$$

$$h(d, n) = \aleph_0 \quad n \ge 3, (d, n) \ne (2, 3)$$

Punching holes into boxes

 $\textbf{piercing} \text{ and } \textbf{volume} \rightarrow \textbf{punching holes}$

n-punching

Family of *d*-dimensional boxes \mathcal{F} is *n*-punchable:

- ▶ $\exists A_1, A_2, ..., A_n$ boxes of volume 1 each
- Any box from \mathcal{F} contains some A_i

Figure: 2-punching a family of 2-dimensional boxes (A and B have area 1)

Question

parameters	Piercing	Punching
1-dimension, n	\checkmark	?
d-dimenion, 2	\checkmark	?
2-dimension, 3	\checkmark	?

Any *h*-tuple is *k*-punchable \implies the whole set is *k*-punchable **Helly-number** *h*?

Problem reduces to *n*-piercing intervals

Proof of Proposition 2

Figure: Construction for d = 2. Punching pairs are of the same color.

Proof of Proposition 2

Figure: Any 6-tuple can be punched by 2 big boxes.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

Discussion

Upper bound:

- ▶ 1-punching: h = 2d
- 1 box: 2d facets
- The facets of the punching box are determined by a subfamily of size at most 2d

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Conjecture: $h \leq 4d$ for 2-punching

2 boxes : 4d facets in total

Upper bound problems

Figure: The highlithted boxes are bordered by the boxes of given color

Upper bound problems

Regrouping the tuples is a problem

Figure: The highlighted boxes are the maximal punching boxes of this tuple
